

CICD

Magic of IT Industry

Dawn of development

- Modern software development demands a system where multiple developers can simultaneously work on different features of the same application.

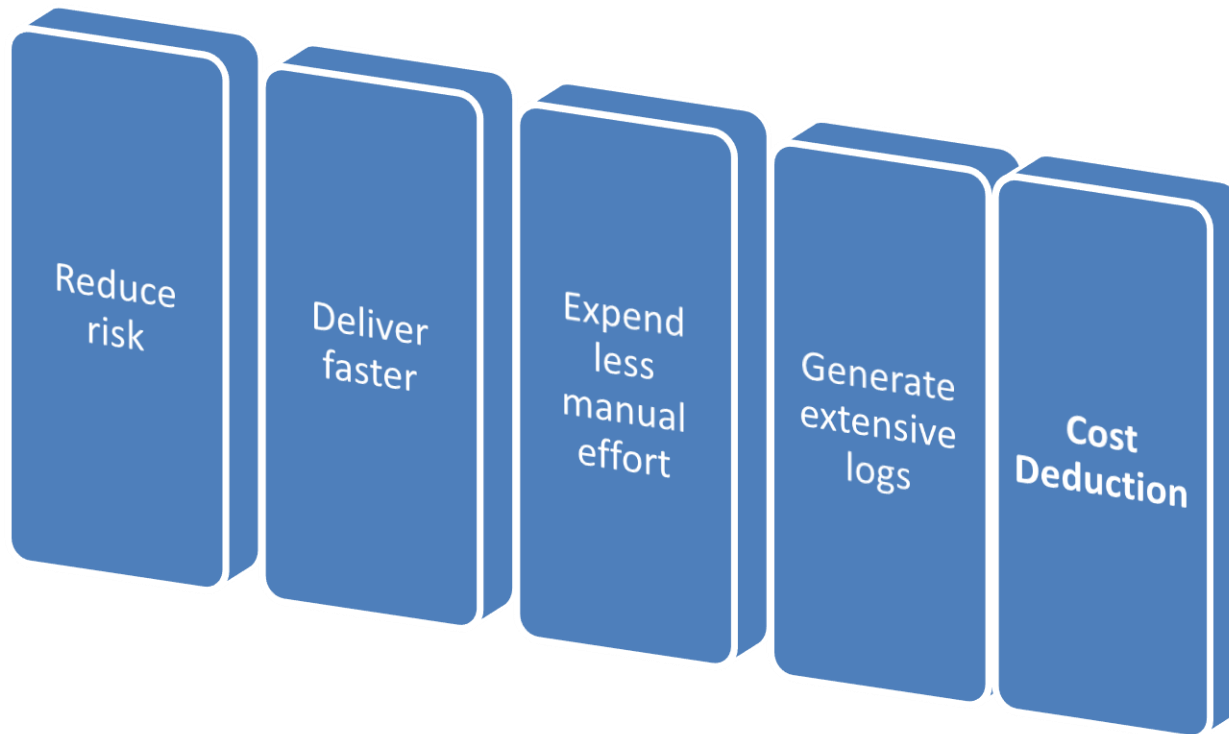

- The challenge arises when developers set up to merge all the source code in a single day.

As a result, developers make changes in the application which often conflict with similar changes made by the other developers. Things become worse when developers customize their IDEs instead of a common cloud-based IDE.

CICD

- Embracing CI/CD is the perfect fix to shorten the time to finish a project and market new features.

The shorter the development cycle, the higher the chances are to meet ambitious time-to-market goals.
